

PROPHESSEE

METAVISION FOR MACHINES

ABOUT US

A B O U T U S

PROPHESSEE IN SHORT

Prophesee is the inventor of the world's most advanced neuromorphic vision systems.

The company developed a breakthrough **Event-Based Vision** approach to machine vision. This new vision category allows for **significant reductions of power, latency and data processing requirements** to reveal what was invisible to traditional image-based sensors until now.

Prophesee's patented **Metavision® sensors and software suite** mimic how the human eye and brain work to dramatically improve efficiency in areas such as **industrial automation, mobile, IoT, security & surveillance, and AR/VR**.

Prophesee is based in Paris, with local offices in Grenoble, Shanghai, Tokyo and Silicon Valley. The company is driven by a team of **100+ visionary engineers**, holds more than **50 international patents** and is backed by leading international investors including Sony, iBionext, 360 Capital Partners, Intel Capital, Robert Bosch Venture Capital, Supernova Invest, and European Investment Bank.

~~RAW DATA~~
ESSENTIAL
INFORMATION

In a traditional Frame-Based sensor, the whole sensor array is triggered at a **pre-defined rhythm**, regardless of the actual scene's dynamics.

This leads to the acquisition of **large volumes of raw, undersampled or redundant, data.**

In Prophesee's patented Event-Based sensor, **each pixel intelligently activates** itself depending on the contrast change (movement) it detects.

This enables the acquisition of only and all **essential motion information**, continuously, **at the pixel level.**

REVEALING THE
INVISIBLE
BETWEEN THE
FRAMES

WE HAVE BEEN DOING THE SAME THING FOR CENTURIES

CAPTURE MOTION VIA STATIC REPRESENTATIONS

CAMERA OBSCURA

FRÈRES LUMIÈRE

SCUOLA DI ATENE - RAFFAELLO

EADWEARD MUYBRIDGE

On the LEFT, a simulation of **Frame-Based Vision** acquisition of a rotating dot,

This approach leverages traditional cinema techniques and records a **succession of static images** to represent movement.

Between these images, there is nothing, the system is blind, by design.

On the RIGHT, the same scene recorded using **Event-Based Vision**.

There is no gap between the frames, because there are no frames anymore.

Instead, a continuous stream of essential information **dynamically driven by movement**, pixel by pixel.

ONLY THE ESSENCE OF THE SCENE

10 to 1000 times less data
processed in comparison to
standard approaches.

WITH UNPARALLELED POWER EFFICIENCY LEVELS

<10 mW

THE HYPER FAST AND FLEETING

Events at sub-millisecond
time scale.

FRAMES VS EVENTS

FRAME-BASED

EVENT-BASED

1. Generates **sequential** static pictures
2. **Clock-driven** (pre-defined frame rate)
3. Needs **exposure times**
4. **Fix amounts** of data
5. Beautiful pictures for **human consumption** (High-resolution, color...)

1. Generates **continuous** events (asynchronous intelligent pixels)
2. **Scene-driven** ($1\mu\text{s}$ time resolution - 10,000 fps equivalent)
3. **No exposure time** (120dB HDR / 40mlux low light sensitivity)
4. Amounts of data **vary with scene dynamics** (10x to 1000x less)
5. Efficient data for **machine vision** (pre-sorted at pixel level, fast, high robustness to challenging lighting conditions, motion-understanding capabilities by design).
